

About the knife templates

- Printing Brisbane's formecut templates contain a 'knife'.
- The 'knife' file has been set-up on the locked 'template' layer of the file.
- Place your PDF file on the 'file' layer and create a new PDF file. The new file will include the 'knife'.

Template Colour

- We have set all our 'knife' lines in Pantone colour '072' and the swatch has been renamed 'knife'.

- **PLEASE NOTE:**

It is important that this remains unchanged.

About the 'knife' file

- The 'knife' file on the 'template' layer is an indicator of where the job will fold. It will not print on your job.
- Please do not alter this file as it represents a pre-determined folded section.
- Only apply forme to the front artwork. If your artwork is double sided the back artwork (second page of the PDF) does not require the knife line

Bleed

- Ensure that you have **3mm** (minimum) of bleed where any background colour/images extend past the trim edge.

Ordering

- **PLEASE** refer to the number that is on the PDF file name, so that we can match up that template with your print job. i.e.: *PF1_A4_SSFNG.pdf*
